

Microbial Source Tracking Study in The Grand River

Vijay Kannappan
Sr. Environmental Health Specialist

Grand River

- Served as an important navigational route through the Lower Peninsula of Michigan.
- Used for centuries by various **Native American tribes** and later by explorers, for traders, and **white settlers**.
- The river was called ***O-wash-ta-nong***, meaning "**Far-away-water**" because of its length.
- The Grand River is the **longest river** in the state of Michigan.

Grand River Watershed

- Runs **252 miles** (406 km)
- Through the cities of Jackson, Eaton Rapids, Lansing, Grand Rapids, and Grand Haven and **empties into Lake Michigan.**
- Grand River watershed drains an area of **5,572 square miles** (14,430 km²).
- Including **18 counties** and **158 townships.**

Grand River

Grand River Discharging into Lake Michigan

EPA Water Quality Standards (WQS) Based on FIB

1950–1972 1000 Total Coliform/100 ml

1972–1986 200 Fecal Coliform/100 ml

1986–2012...! Health Based (Epidemiology)

FOR FRESH WATERS

33 Enterococci CFU/100 ml

126 *E. coli* CFU/100 ml

FOR MARINE WATERS

35 Enterococci CFU/100 ml

7 Enterococci CFU/100 ml (Hawaii)

*Geo mean of at least five samples taken over a period of 30 days

235 *E. coli* CFU/100 ml

61 Enterococci CFU/100 ml

** Single sample regulatory limits

Michigan Beach Water Quality Standards

- Single sample standard : 300 CFU/100ml of *E. coli*
(daily geometric mean of at least three samples).
- 130 CFU *E.coli*/ 100 mL
(monthly geometric mean of at least 5 sampling events)
- Michigan Water Quality Standards for recreational beaches are slightly different from the EPA's criteria.
- Below the EPA's acceptable risk level of 1%
(10 people per 1000 getting sick).

Problem

“FIB such as *E. coli* is not human specific.”

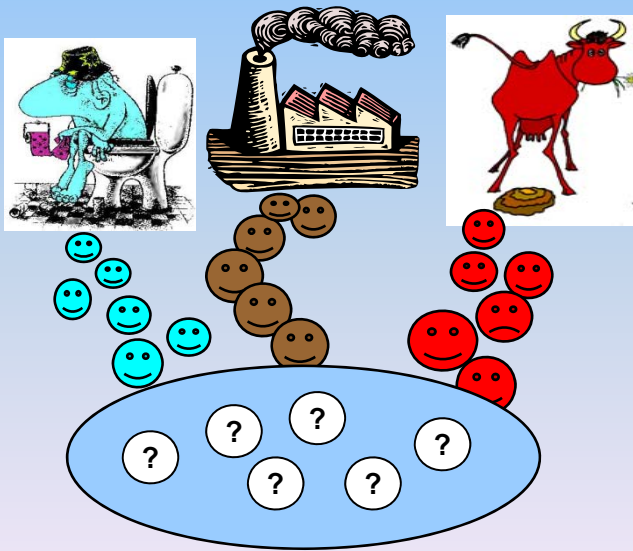

MICROBIAL RISK ASSESSMENT STRATEGY

- SOURCE DETERMINES RISK

- **Human feces/sewage: High Risk.**
Human intestine is habitat for growth of all known human enteric pathogens.
- **Non-human/animal feces: Moderate Risk.**
Majority of human enteric pathogens (human viruses) cannot grow in animal intestines.
- **Environment (soil, plants, sediments): Low Risk.**
No hard evidence that any human enteric pathogens can grow to any level of risk in the environment.

Solution

- Microbial Source Tracking tools identify the sources of FIB (e.g., human, cattle, bird)
- Helps to provide a more rational solution to recreational water-related disease

Alternate FIB : Bacteroides species

- *Bacteroides* is a genus of Gram-negative, rod-shaped, non- endospore forming anaerobes.
- Normal commensals in mammalian gastro intestinal tract and feces.
- Make up a significant portion of the fecal bacterial population.
- Present in intestine and feces at thousand times greater than *E. coli*.
- Unlike *E. coli*, *Bacteroides* spp. do not proliferate in the environment
- *Bacteroides* hosts (human, cow, swine) are well established for environmental application.
- Examples of *Bacteroides* species :
B. fragilis, *B. thetaiotaomicron*, *B. uniformis*,
B. ovatus, *B. vulgatus*, *B. caccae*, *B. eggerthii*.

The Use of DNA based source tracking is very effective

- State Of The Art Technique
- Accurately identifies the target/source
- DNA Finger Printing: Library based method

Challenging Regulatory Standards

- *E. Coli Vs Bacteroides*

E. coli (Traditional FIB)

- Culture method
- Existing standards are based Epi study
- Well established, regulated and mandated by USEPA.
- Not human specific

Bacteroides spp. (Alternate FIB)

- Molecular method.
- More target (cow, swine, human) specific.
- No Epi study was conducted.
- Approved but not regulated by USEPA.

Grand River Water Sampling

Sampling Period : May to August 2012

E. coli monitoring : Once a week (14 sampling event)

Microbial Source Tracking : Once a Month (4 sampling events)

E. coli -Idexx-Colilert

Bacteroides- qPCR

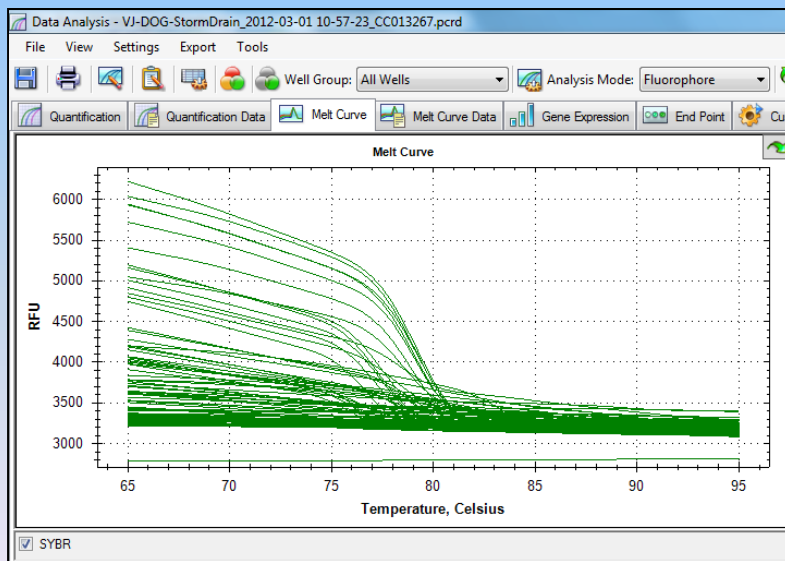

Bacteroides- qPCR

General bacteroides: bac708R, bac32F

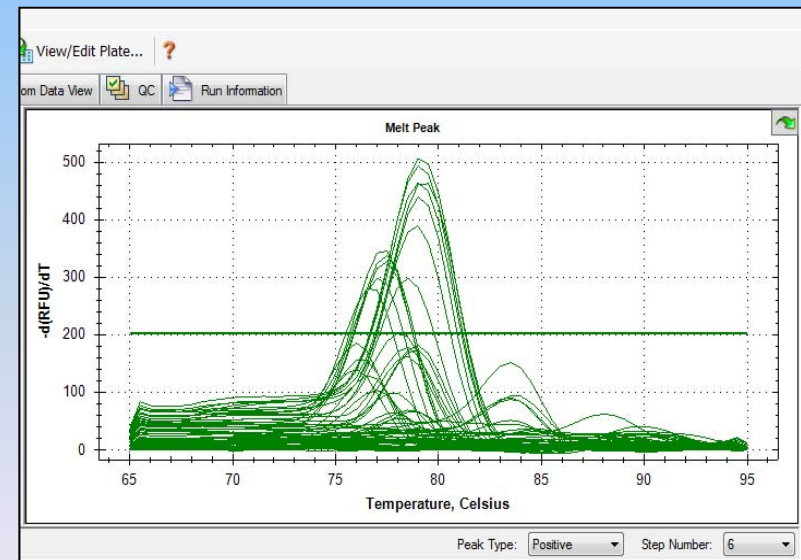

Human: HrevShort, HF183

Cow: HrevShort, CF128

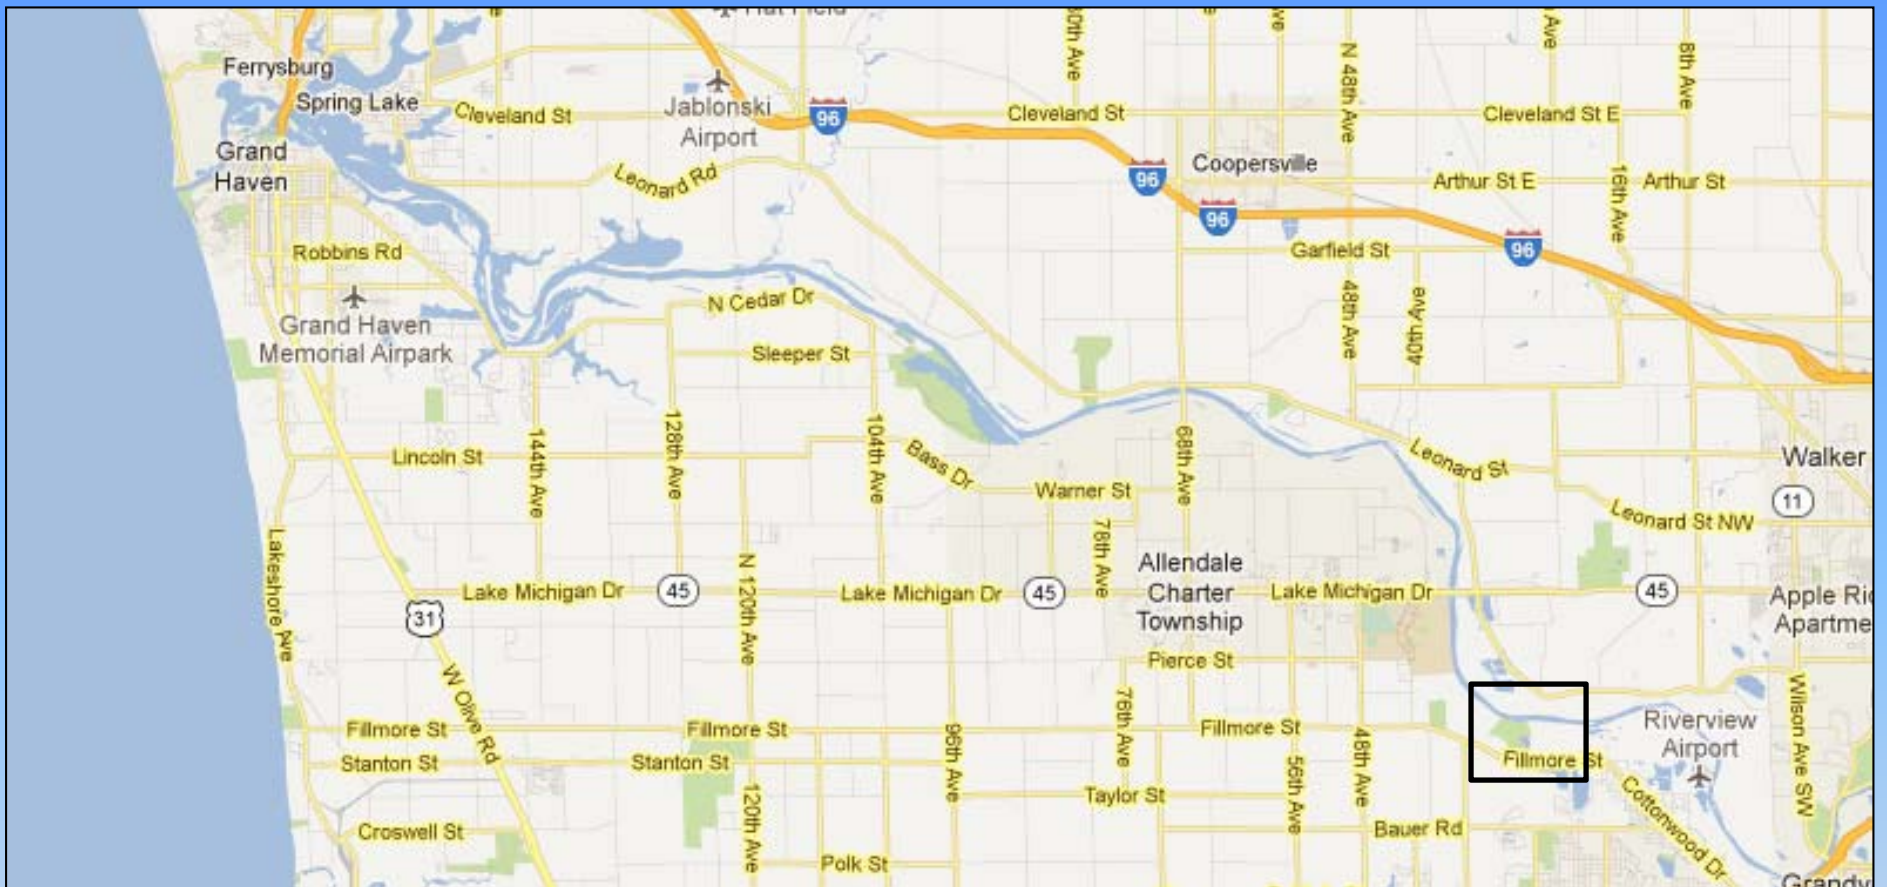

Pig: 708R, PF163F

Cycle Threshold (ct)
- concentration of the target DNA

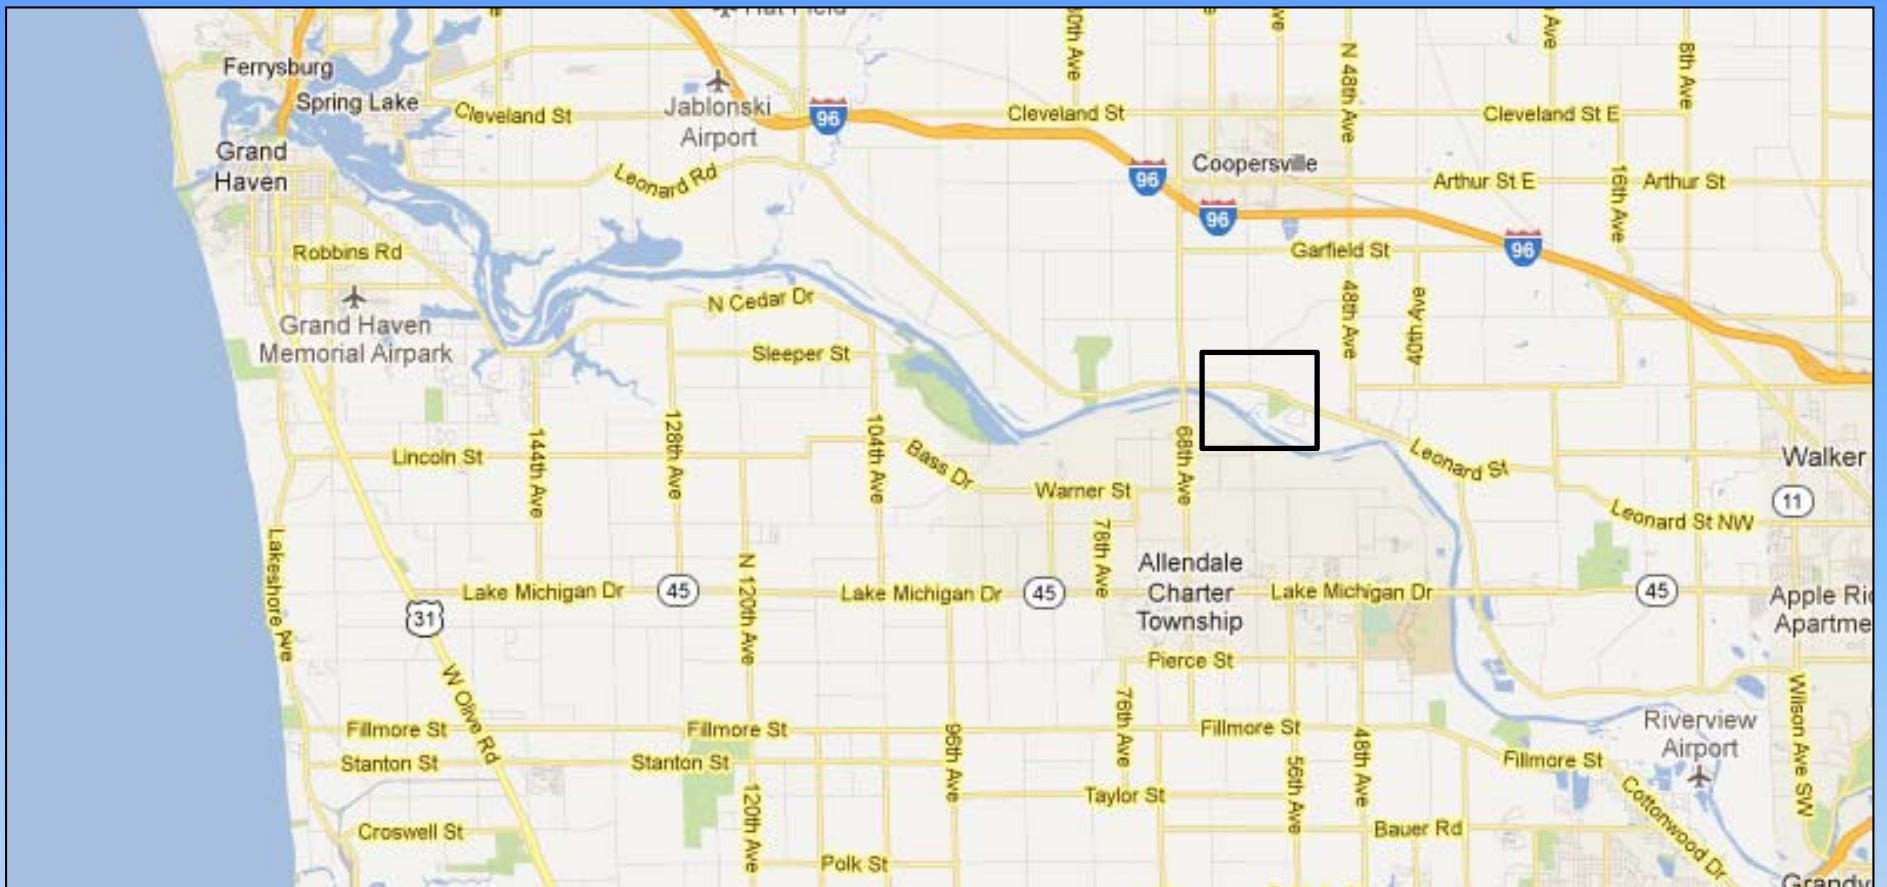

Melt Curve
- characteristics of the target DNA

Swine 10 ⁻⁴	38			

Study Findings: *E. coli*

- Low levels
 - below the state approved regulatory standards.
- Concentration ranged
 - from 20 to 280 MPN/100ml.
- Water quality rating : Good

Study Findings : General Bacteroides

- Were present in all the tested samples
- Comparable to 10^{-3} concentration of sewage.
- Water quality rating : No conclusion can be drawn

Study Findings : Human specific Bacteroides

- Scarcely present.
- Very Low concentrations.
- Comparable to 10^{-6} concentration of sewage.

(GR1 site; August sample comparable to 10^{-3} sewage concentration)

- Water quality rating : Good

Study Findings : Cow specific Bacteroides

- Scarcely present.
- Low concentrations
- Comparable to 10^{-5} concentration of cow feces.
- Water quality rating : Good

Study Findings : Swine specific Bacteroides

- Moderately present.
- Low concentrations
- Comparable to 10^{-4} concentration of swine feces.
- Water quality rating : Moderate to low risk

What's next?

- Extend the source tracking to Geese, and Gulls specific markers.

- The Bacteroides target is not well established.
- Researches are still debating the use of best marker.
- Our research in Hope College confirmed the same (low Bacteroides targets in gulls and goose feaces).
- Will continue to research the best markers for gulls and goose.
- The Grand River DNA samples has been archived for future studies.
